Final Paper

10/19/25

The Scrum Team consists of a Product Owner, a Scrum Master, a Developer Team(s), and Testers. The goal of the SNHU Travel Project was to develop an application that targets audiences looking to book a travel trip. The Product Owner is responsible for providing clarity to the team and ensuring they understand the product's goals. The Product Owner is also responsible for meeting with stakeholders and creating a product backlog. The Product Owner will meet with stakeholders to ensure that the team is meeting the products goals and to ensure the needs of the product are being met, in the instance that the needs of the product will change it is the responsibility of the Product Owner to keep the Scrum Team updated. For the SNHU Travel Project, the Product Owner met with the shareholders to obtain feedback on the system and what the users' needs are; the Product Owner was then able to communicate this to the team using user stories.

User stories were used to guide the team on what needed to be accomplished and what the goals of the project are. The user stories are written in a format such as “I am [who], I want [what], so that [why]”. The overall goal of this format is to allow the team to understand the needs of the user while presenting them in simple, easy-to-understand, terms that are accessible.

An example of this would be the user stories created in assignment 3-2.

After stakeholders decided to shift the website’s focus toward highlighting additional detox and wellness locations, the project’s direction changed significantly. The Product Owner gathered the

new user stories and met with the team to communicate the updated priorities. Using agile practices, the team was able to effectively make the right changes and continue with the product.

Hello PO,

After reviewing the user stories, I have some details I would like to go over with you. There are some gaps specifics with the user stories that I would like to cover to ensure that we are properly meeting the user's needs. Along with that there are other questions I have about the format of which the system should be set up in. We need to go over specifics on how the page should look and where clickable links and other features should be located.

Please reach out to me at your earliest convenience.

Thanks,

This is a sample of my ability to effectively communicate with the team. Reaching out to the Product Owner for clarity and clearer communication on the product is an example of how I can communicate clearly within the team. It is important to have clear communication within the team to ensure that everyone understands the product's goal. It is also important to have consistent communication and follow-up to ensure that there are no gaps in knowledge and everyone is on the same page.

An Agile project management tool like JIRA helps improve team coordination and efficiency by providing a centralized space to plan, track, and manage work. Through visual

boards, team members can easily see task progress, identify blockers, and stay aligned on priorities. Real-time updates, comments, and notifications promote collaboration while reducing the need for lengthy meetings or emails. JIRA's reporting features, such as burndown charts and velocity tracking, also support continuous improvement by highlighting performance trends. Overall, the tool streamlines communication, enhances transparency, and keeps the team focused on shared goals.

The Scrum-Agile approach for the SNHU Travel Project was largely effective. It supported teamwork, flexibility, and consistent advancement throughout the project. Some cons of the Scrum-Agile approach would be the use of small teams, extensive training, and the need for expertise.

Overall, I believe that the Scrum-Agile approach was the best approach for the SNHU Travel Project development. It allowed the team to work in short, manageable sprints, delivering functional parts of the application regularly. This iterative process made it easier to adapt to changing requirements and incorporate feedback from stakeholders throughout development. The frequent collaboration and structured meetings also helped keep the team aligned and focused, which is especially valuable in a learning environment where team members are developing both technical and project management skills.
