Explaining Agile Roles

Product Owner

- The Product Owner is responsible for providing clarity to the team on the product goal.
- The Product Owner shall collaborate with stakeholders to capture the product goal. The PO will continue to collaborate with stakeholders throughout the development process
- All decisions will ultimately go through the Product Owner as they are responsible for the end goal.

Scrum Master

- The Scrum Master is responsible for ensuring the team understands Scrum and follows Scrum Practices.
- The Scrum Master is a servant leader and is to ensure that the Scrum Team is free of any roadblocks.

Developer

- The Developer is responsible for creating usable increments each sprint
- The Developer is a member of scrum that works towards product goal
- The Developer can work on any kind of work towards the product not just programming.

Tester

- The Tester is responsible for ensuring that the program meets all test case scenarios.
- The Tester will analyze errors and failure conditions and work to fix them.
- The Tester acts as both a quality coach and an active developer.

Explaining Agile Phases

- Planning: Define the product goal, identify stakeholder, prioritize initial backlog.
- Backlog Refinement: Break down large features into user stories, clarify requirements, prioritize backlog items based on value.
- Sprint Planning: Decide which backlog items to deliver, define a sprint goal, create a sprint backlog.
- Development: Design, code, and test features.
- Testing: Test features to ensure they meet requirements, identify issues.
- Review: Gather feedback and make adjustments accordingly.
- Launch: Launch the completed product.

The Waterfall Method

The Waterfall Method is a traditional linear approach to project management. This method flows sequentially in a series of phases. Each phase of this method must be completed before moving to the next phase. There are 5 phases of The Waterfall Method. Requirements, Design, Implementation, Verification, and Maintenance.

Overall, The Waterfall Method is generally good for projects with clear, stable requirements that are not subject to change.

Waterfall vs Agile: Which is better?

When it comes to choosing an approach to a project, agile is the better choice. Agile allows for change and adaptability when developing a project whereas the Waterfall Method is good for more set in stone requirements that are not subject to change. However, because change is so common agile is the clear better choice.
